In the course of this study, the technology of bleaching of cotton pulp for various purposes has been improved, which can be used in the production of cotton pulp by "Khlopoprom-Cellulose" LLP and other enterprises to increase the production efficiency and competitiveness of the products obtained. The proposed development makes it possible to obtain cellulose with a high degree of polymerization and whiteness, as well as to solve the problem of stabilization and high decomposition rate of hydrogen peroxide in the technological cycle. The bleached cellulose meets the requirements of GOST (State Standard) 595-79 "Cotton cellulose" and has an average degree of whiteness of 90%, which is 5-6% higher than the samples of cotton cellulose bleached without the use of a hydrogen peroxide stabilizer.

Key words: cotton cellulose, stabilization, hydrogen peroxide, reagents, physical and chemical properties;

Осы зерттеуді орындау барысында "Хлопкопром-целлюлоза" ЖШС мақта целлюлоза өндірісінде және алынатын өнімнің бәсекеге қабілеттілігін және өндірістің тиімділігін арттыру үшін басқада кәсіпорындарда пайдаланылуы мүмкін түрлі мақтатагы мақта-целлюлозасын агарту технологиясы жетілдіріледі болады. Ұсынылып отырган әзірлеу полимеризацияция және агартақыш сұйықтық дәрежесінің жоғары көрсеткіштері бар целлюлоза алуға, сондай-ақ технологиялық циклде сутегі пероксидінің ыдырауының жоғары жылдамдығымен тұрақтандыру проблемасын шешуге мүмкіндік береді. Агар-тылган целлюлоза өзінің сапалық сипаттамалары бойынша МЕМСТ 595-79 "мақта Целлюлоза" талаптарына сәйкес келеді және орташа деңгейі 90% актығыбар, бұл сутегін ероксидінің тұрақ-тандырғышын пайдаланбай агартылган мақта целлюлоза улгілерімен салыстырғанда 5-6% жоғары.

Негізгі сөздер: мақта целлюлоза, стабилизация, сутегіпероксиді, реагенттер, физико-химиялық қасиеттері;

В ходе выполнения настоящего исследования усовершенствована технология отбелки хлопковой целлюлозы различного назначения, которая может быть использована в производстве хлопковой целлюлозы ТОО «Хлопкопром-целлюлоза» и других предприятий для повышения эффективности производства и конкурентоспособности получаемой продукции. Предлагаемая разработка позволяет получить целлюлозу с высокими показателями степени полимеризации и белизны, а также позволит решить проблему стабилизации и высокой скорости разложения пероксида водорода в технологическом цикле. Отбеленная целлюлоза по своим качественным характеристикам соответствует требованиям ГОСТ 595-79 «Целлюлоза хлопковая» и имеет среднюю степень белизны 90%, что на 5-6% выше, по сравнению с образцами хлопковой целлюлозы, отбеленными без использования стабилизатора пероксида водорода

Ключевые слова: хлопковая целлюлоза, стабилизация, пероксид водорода, реагенты, физико-химические свойства;

Introduction

In this production cotton cellulose is produced on the technological line intended for processing of cotton raw materials into cellulose. The technological process consists of stages of dry mechanical purification of raw materials from mineral and organic waste, chemical purification, which consists in sequential processing of purified cotton raw materials by solutions of alkali and wetting agent in the process of boiling, washing, bleaching with hydrogen peroxide solution, washing, drying and packaging of the finished product.

The equipment of the technological line is located in the opening and cleaning area, in the chemical cleaning area and in the drying and packaging area. The technological line is equipped with equipment and machines of various companies, the characteristics of which are shown in Table 1 of Section 2.

Materials and research methods

All equipment in the continuous opening and cleaning area is connected in series with galvanized air pipes and belt conveyors. In the chemical cleaning and drying section the equipment of periodic action (boilers and

bleaching tanks) and continuous action (water pumping unit, aerofontaneous drying unit, packaging press) is installed.

Technical specifications for hydrogen peroxide stabilizer had been developed. Sodium silicate plays a two-way role: as a hydrogen peroxide decomposition stabilizer and as a catalyst in the conditions of bleaching [1,2]. That's its unique property.

These technical specifications apply to the hydrogen peroxide stabilizer, derived from organic and inorganic compounds, intended for use in the bleaching of fibrous materials.

All requirements of these technical specifications are compulsory and suitable for certification.

Table 1 - Physical and chemical indicators of the stabilizer

Indicator Name	Characteristics and standards	Test Methods
Appearance	Homogeneous and viscous liquid	
Colour	From white to slightly yellow according to the reference sample.	
Relative viscosity, c	min. 20	State standart 8420
Mass fraction of volatiles, %	max. 65	State standart 17537
Hydrogen index, aqueous solution pH of 10 g/l concentration	9,0-12,0	State standart 8433

In the production conditions of KMC-2000 LLP "Khlopkoprom-cellulosa" was obtained a pilot batch of stabilizer № 4 in the amount of 500 kg for use in the process of bleaching cotton cellulose.

Results and their discussion

Stabilizer №4 was produced according to the following technological procedure:

DTPA 5NA is a known nitrogen-containing chelating agent both in the free form and as salts of alkali metals [3,4,5].

The record of the hydrogen peroxide stabilizer when ordering must consist of the product name with the raw material designation, the number of these technical specifications and the technical description (TD) number or a drawing for a specific product type.

«Hydrogen peroxide stabilizer CT TOO 40936697-005-2019 (ST TOO 40936697-005-2019) ».

According to the physical and chemical indicators, the stabilizer must meet the standards are given in Table 1.

[Auxiliary work stages] → [Prepare facilities and equipment] → [Staff training] → [Prepare the raw materials] → [Load components] → [Mixing] → [Filtering] → [Filling] → [Labeling].

The equipment scheme of the low silicate stabilizer №4 production is given below:

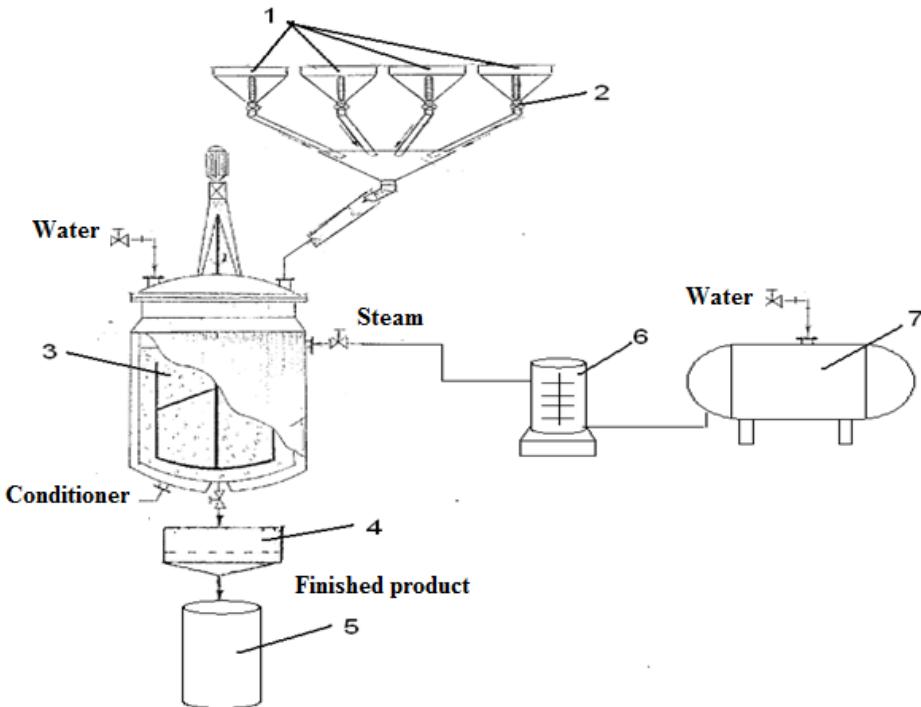

Figure 1- Equipment scheme of the low silicate stabilizer №4 production.

1.-tank for components; 2 - dozers; 3 - reactor; 4 - mesh filter; 5 - vessel for finished products; 6 - steam boiler; 7 - water tank.

The obtained hydrogen peroxide stabilizer meets the requirements of ST TOO 40936697-005-2019 "Hydrogen Peroxide Stabilizer" and has the following characteristics:

Table 2 - Physical and chemical indicators of stabilizer №4

№	Indicator Name	According to ST TOO 40936697-005-2019	Experimental batch
1	Appearance	Homogeneous and viscous liquid	complies with standard
2	Colour	From white to slightly yellow.	complies with standard
3	Relative viscosity, c	min 20	34
4	Mass fraction of volatiles, %	max 65	55
5	Hydrogen index, aqueous solution pH of 10 g/l concentration	9,0-12,0	11,2

Ten pilot batches and 10 tons of cotton cellulose have been produced. Cotton cellulose bleaching processes were carried out within the framework of technological regulations for bleached cotton cellulose production.

Bleached cotton cellulose obtained by using a new hydrogen peroxide stabilizer meets

the requirements of state standart 595-79 "Cotton cellulose" according to its quality characteristics.

The results of physical-mechanical and chemical experiments are given in Table 3.

Table 3 - Results of physical-mechanical and chemical experiments

Indicators	GOST (State Standard) 595-79.	Actual results
	1st grade	
Appearance	The loose mass of white color, not containing foreign particles in the form of pluck, sand, pieces of rubber, metal impurities and other impurities of non-cellulose character.	complies with standard
Mass fraction of alpha cellulose, %	min.98,0	98,9
Mass fraction of water, %	max. 10,0	8,2
Mass fraction of ash, %	max. 0,2	0,18
Mass fraction of insoluble residue in sulfuric acid, %	max. 0,30	0,20
Wettability, g	min. 140	135
Whiteness, %	min.85	90
Mass fraction of fibrous dust. % max.	max. 2.0	1.2
Dvynamic viscosity. mPa.s.	(21-30)	23

Conclusions

The results of the conducted experiments showed that:

1. Bleached cotton cellulose obtained by using a new hydrogen peroxide stabilizer is in accordance with the physical, mechanical and chemical indicators of the standard technical document for the produced products.

2. The obtained new hydrogen peroxide stabilizer can be used in production of cotton cellulose and hygroscopic mats without interrupting the stable operation of production.
